Summary

DevSecOps and platform engineer with 9+ years across cloud infrastructure, Kubernetes, CI/CD, and backend services on Azure and AWS. Builds the platform layer — observability, infrastructure as code, hardened delivery pipelines — and has shipped the Node.js and .NET services that run on it. Comfortable owning a system end to end, from Terraform module to production incident.

Technical Skills

Cloud & IaC	Azure (AKS, Key Vault, App Service, WebJobs), AWS (EKS, ECS Fargate, Lambda, API Gateway, DynamoDB, S3, SQS/SNS), Terraform, CloudFormation
Kubernetes & Observability	Kubernetes, Helm, Docker, Grafana LGTM stack (Loki, Grafana, Tempo, Mimir), cert-manager, ingress-nginx, Traefik, Inlets Pro
DevSecOps & CI/CD	GitHub Actions, Jenkins, Harness, Ansible, SonarQube, Black Duck, Keycloak (OAuth2), Tailscale, Authentik
Languages & Backend	C# / .NET, JavaScript / Node.js (Express), Python (Flask), Bash, SQL, HCL, React, Microsoft Graph API, MSSQL, MySQL, MongoDB, Redis

Experience

OMICRON electronics

Klaus, Austria

DEVSECOPS ENGINEER / SOFTWARE ENGINEER

Dec 2025 – Present

- Designed and deployed an observability platform on Azure Kubernetes Service (AKS) with the Grafana LGTM stack (Loki, Grafana, Tempo, Mimir), unifying metrics, logs, traces, and alerting.
- Provisioned the underlying Azure infrastructure from scratch with modular Terraform, making every environment reproducible from code.
- Packaged the whole stack into a custom umbrella Helm chart for repeatable, versioned deployments.
- Currently applying DevSecOps practices across the platform: cloud infrastructure security, vulnerability management, and CI/CD pipeline hardening.

OneAdvanced

Bengaluru, India

SENIOR SOFTWARE ENGINEER

Feb 2021 – Oct 2025

- Built a secure middleware microservice on AWS ECS Fargate (Node.js, Lambda, DynamoDB) with OAuth2 authentication via Keycloak, handling 100K+ transactions a day at 99.9% uptime.
- Deployed and operated production Kubernetes clusters on AWS EKS, running Inlets Pro as a reverse-proxy exit server with cert-manager TLS and zero-touch deployment.
- Implemented end-to-end CI/CD on GitHub Actions and Harness with infrastructure defined in CloudFormation and Terraform, removing about 80% of manual release work.
- Designed reusable .NET Worker Service templates for event-driven backends (logging, encryption, database access) that cut duplicated code by 60% across projects; built Azure WebJobs webhook endpoints for real-time integration with Microsoft services.
- Fixed penetration-test and SonarQube findings across services and cut AWS spend by \$1,000+ per month through right-sizing, reserved instances, and automated shutdown of idle resources.
- Ran internal training sessions on AWS and DevOps practices for the engineering team.

OneAdvanced

Bengaluru, India

SOFTWARE ENGINEER

Mar 2018 – Feb 2021

- Built a .NET WinForms installer that automated software installation and database updates, cutting setup time from 1 hour to 5 minutes.
- Co-developed a serverless customer portal on AWS Lambda, API Gateway, and S3, including React front-end components.
- Rewrote critical SQL stored procedures for a 50% query-performance gain; automated builds and deployments with Jenkins.

Samsung R&D Institute India

Bengaluru, India

TEST ENGINEER

Mar 2017 – Nov 2017

- Authored and executed 600+ functional, integration, performance, and regression test cases for Project Bixby; managed test-server deployments and analyzed Android crash logs with ADB/DDMS.

Projects

Homelab Infrastructure github.com/punitpi/homelab

RASPBERRY PI, ANSIBLE, DOCKER, TAILSCALE, TRAEFIK, AUTHENTIK, RESTIC

2024 – Present

- Four-node, infrastructure-as-code homelab: a cloud edge proxy (Traefik) reaches Raspberry Pi nodes over a Tailscale mesh with no ports exposed to the internet; Authentik SSO, a standby node for failover, and nightly Restic backups to Backblaze B2 with one-command restore.
- Every service (AdGuard Home DNS, Uptime Kuma monitoring, FreshRSS, code-server, and more) runs as an Ansible-deployed Docker Compose stack, so the whole setup is reproducible and version-controlled.

Azure Terraform Modules github.com/punitpi/tf-azure-template

TERRAFORM, AZURE2025

- Reusable, per-environment Terraform modules for resource groups, virtual networks, storage, Key Vault, and App Service, with a remote state backend.

TypedByMe Portfolio typedbyme.puneeth.io

HUGO, GITHUB ACTIONS, LATEX2024 – Present

- Personal site and technical blog; this résumé is built from LaTeX in CI, published as a GitHub Release, and synced into the site on every push.

Spotify Now Playing API github.com/punitpi/spotify-now-playing

CLOUDFLARE WORKERS, NODE.JS, OAUTH22024

- Lightweight proxy for Spotify’s Currently Playing API with automatic OAuth token refresh, CORS, and edge caching; deployable to Workers, Docker, or Node.
